TIME
THERE IS NEW AMMUNITION IN THE WAR AGAINST CANCER.
THESE ARE THE BULLETS.
Revolutionary new pills like GLEEVEC combat cancer by targeting only the diseased cells. Is this the breakthrough we've been waiting for?

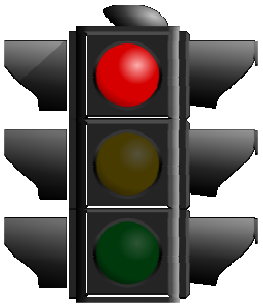
WHY ANTICANCER DRUGS FAIL?

2013

« I cure people »

« I manage survival »

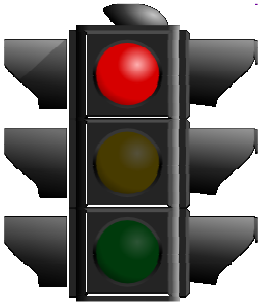
WHY ANTICANCER DRUGS FAIL?



Pharmacological issues?

- Resistances at the tumor level
- Target Amplification
- Mutations on Target
- Mutations on signaling pathways
- Increased Detoxification
- Repairing process
- Impaired apoptosis

WHY ANTICANCER DRUGS FAIL?



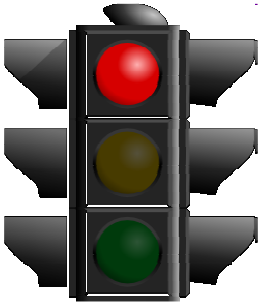
PD issues are addressed!

Within a given cancer type, genetic profiling (e.g., OncoType DX, MammaPrint in breast cancer) helps to discriminate tumor subtypes so as to help choosing the best treatment.

Different tumors require different treatments!

« One tumor = one treatment » paradigm

WHY ANTICANCER DRUGS FAIL?



PD issues are addressed!

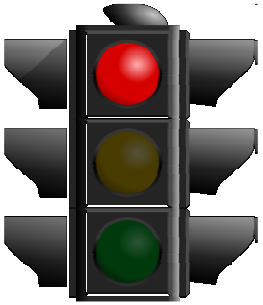
« Thou shalt not give cetuximab or panitumumab if mutated K-Ras »

« Thou shalt not give herceptin if Her2 is not expressed »

« Thou shalt not give tamoxifen if ER negative »

… ..

WHY ANTICANCER DRUGS FAIL?



PD issues are addressed!

Despite the ever-increasing number of valid biomarkers identified to select patients likely to respond…..

…. this does not necessarily lead to increased survival in patients!

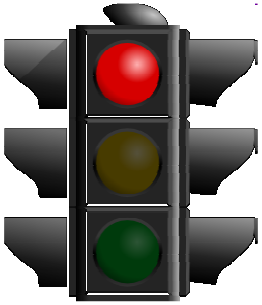
WHY ANTICANCER DRUGS FAIL?

- **Metastatic colorectal Cancer**

The latest targeted therapies have little impact on survival despite pre-therapeutic search for biomarkers (eg, EGFR-1 expression and K-Ras status)

	CRYSTAL Folfiri + cetu n=316	OPUS Folfox+ cetu n=82	PRIME Folfox4 + pani n=325	IFL + beva n=393	Folfox/ Xelox + beva n=699	TREE Folfox + beva n=71	FOLFIRI	FOLFOX
DFS (month)	9.9	8.3	9.6	10.6	9.4	9.9	8.7	8
OS (month)	23.5	22.8	23.9	20.3	21.3	26.1	21	18.5

WHY ANTICANCER DRUGS FAIL?



Beside Pharmacological issues…

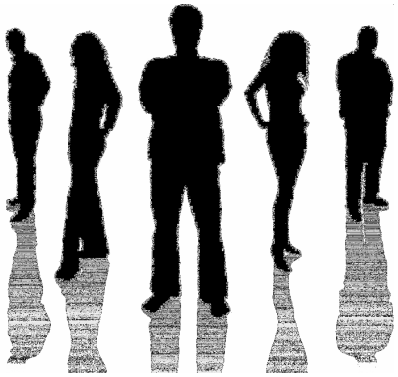
….. non-Pharmacological issues?

Prof. Merrill J. *Egorin* (1948–2010)

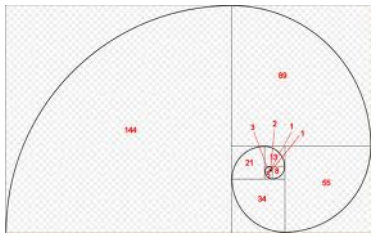
« It's the PK, stupid! »

WHY ANTICANCER DRUGS FAIL?

- Fibonacci, or Fibonacci-like designs?



- The Fibonacci numbers have been first theorized to count rabbits in the 13th century!



WHY ANTICANCER DRUGS FAIL?

- Modified-Fibonacci design (aka 3+3 design)

Treat 3 patients at dose K:

1.If 0 patients experience dose-limiting toxicity (DLT), escalate to dose K+1
2.If 2 or more patients experience DLT, de-escalate to level K-1.
3.If 1 patient experiences DLT, treat 3 more patients at dose level K
   A.If 1 of 6 experiences DLT, escalate to dose level K+1
   B.If 2 or more of 6 experiences DLT, de-escalate to level K-1

MTD: highest dose at which 1 or 0 out of six patients shows DLT.

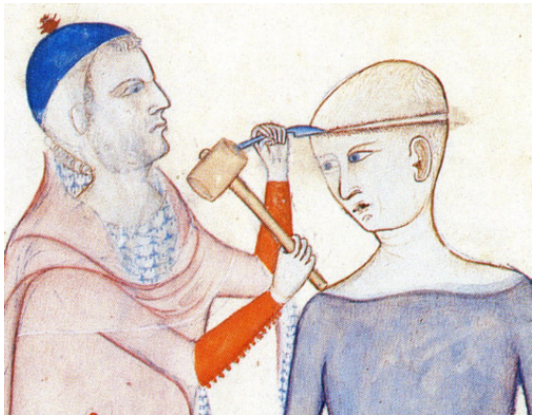
Imprecise MTD leads to weak phase-II studies

Weak phase-II studies lead to failing phase-III studies

Attrition-rate during clinical development: 90%

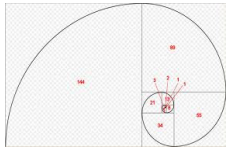
WHY ANTICANCER DRUGS FAIL?

- Since tumors are removed using 21th century surgery, and not 13th century…

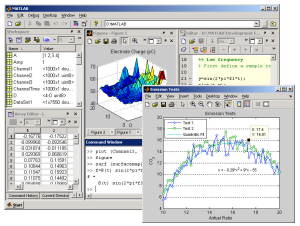


- Time to use 21th century mathematics!

WHY ANTICANCER DRUGS FAIL?



Standard Design



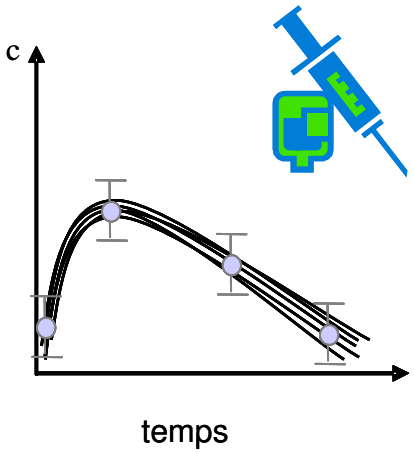
Adaptative Design

- Pre-specified doses before starting!
- Geometric dose-ranging
- MTD is not based on all the data
- Rates of toxicities is ignored
- Resulting MTD is imprecise!

- Upper doses constantly re-assessed
- Multi-level Model to calculate the doses
- All available data are used
- DLT definition can be customized

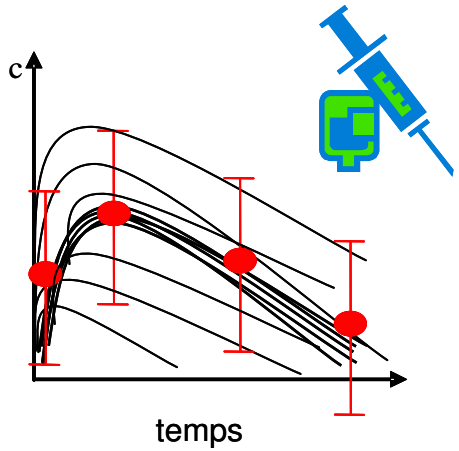
WHY ANTICANCER DRUGS FAIL?

Clinical Trial



- Limited population (n<1 000)
- Highly selected patients
- Smoothed clinical co-variates.
- Age: 18-65 years
- Little, or well-known comorbidities
- Controlled lifestyle

Real Life

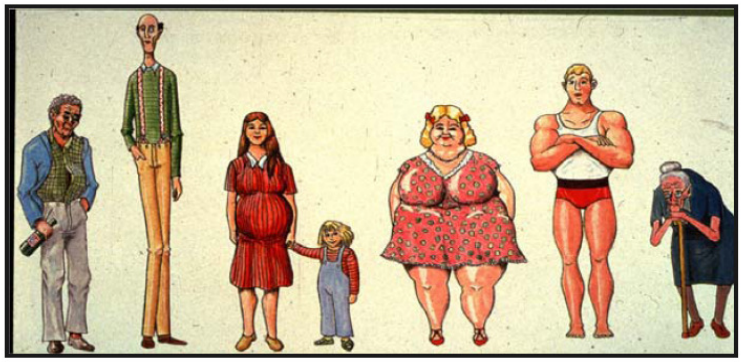


- Unlimited sample
- Unselected patients
- Dispersion of clinical covariates
- Elderly patients
- Many comorbidities, some unknown
- Variety in lifestyles

WHY ANTICANCER DRUGS FAIL?

Clinical Trial

Real Life



$$D = \frac{Cl \times C_{moy} \times \tau}{F}$$

?

PK OF ANTICANCER DRUGS

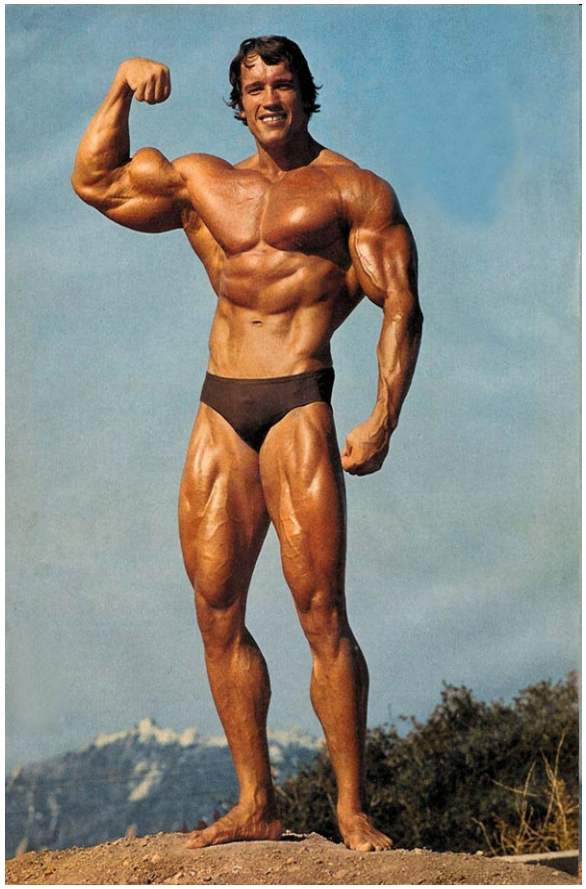
What makes PK changes?

- Age (most cancer patients are > 65 years)
- Drug-Drug Interactions (most cancer patients are heavily treated)
- Co-morbidities affecting kidneys and/or liver.
- Genetic polymorphism affecting drug transport – drug metabolism.
- Denutrition.
- Environmental factors.
- Food (most TKIs are oral drugs)
- Tumor burden (biotherapies)

WHAT MAKES PK CHANGES?

Age!

20 y.o.



60 y.o.

WHAT MAKES PK CHANGES?

Food!

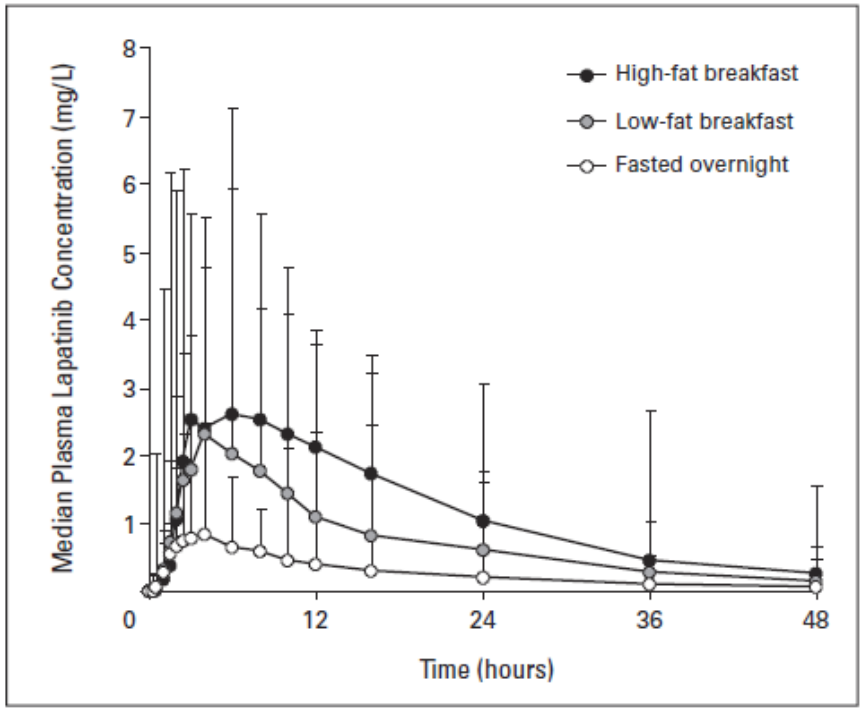


Fig 1. Median and upper ranges of plasma lapatinib concentrations versus time following a 1,500-mg dose administered after fasting overnight, after a low-fat breakfast, and after a high-fat breakfast.

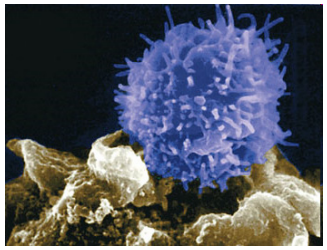
PK OF ANTICANCER DRUGS

PD issues are adressed
…. What about PK issues?

A unique patient



A unique tumor

A unique treatment

Personalized dosing
?

PK OF ANTICANCER DRUGS

Identifying individual PK parameters should allow to improve the efficacy/toxicity balance of anticancer drugs through identifying outliers requiring customized dosing:

- Identifying poor metabolizer (PM) patients.
- Identifying patients with impaired drug elimination/transport.
- Identifying patients displaying higher clearances requiring increase in dosing.
- Understanding the relationships between drug concentrations and antiproliferative effect.
- Understanding the relationships between drug concentrations and toxicities.

Sudden Death Related to Toxicity in a Patient on Capecitabine and Irinotecan Plus Bevacizumab Intake: Pharmacogenetic Implications

Introduction

Capecitabine is an oral alternative to fluorouracil (FU) frequently administered as part of combination therapies in digestive oncology. This prodrug is designed to be activated through a triple enzymatic

Case Report

Cancer Chemother Pharmacol
DOI 10.1007/s00280-008-0889-1

SHORT COMMUNICATION

Early severe toxicities after capecitabine intake: possible implication of a cytidine deaminase extensive metabolizer profile

Plasma exposure drives the PD…. not the dosing!

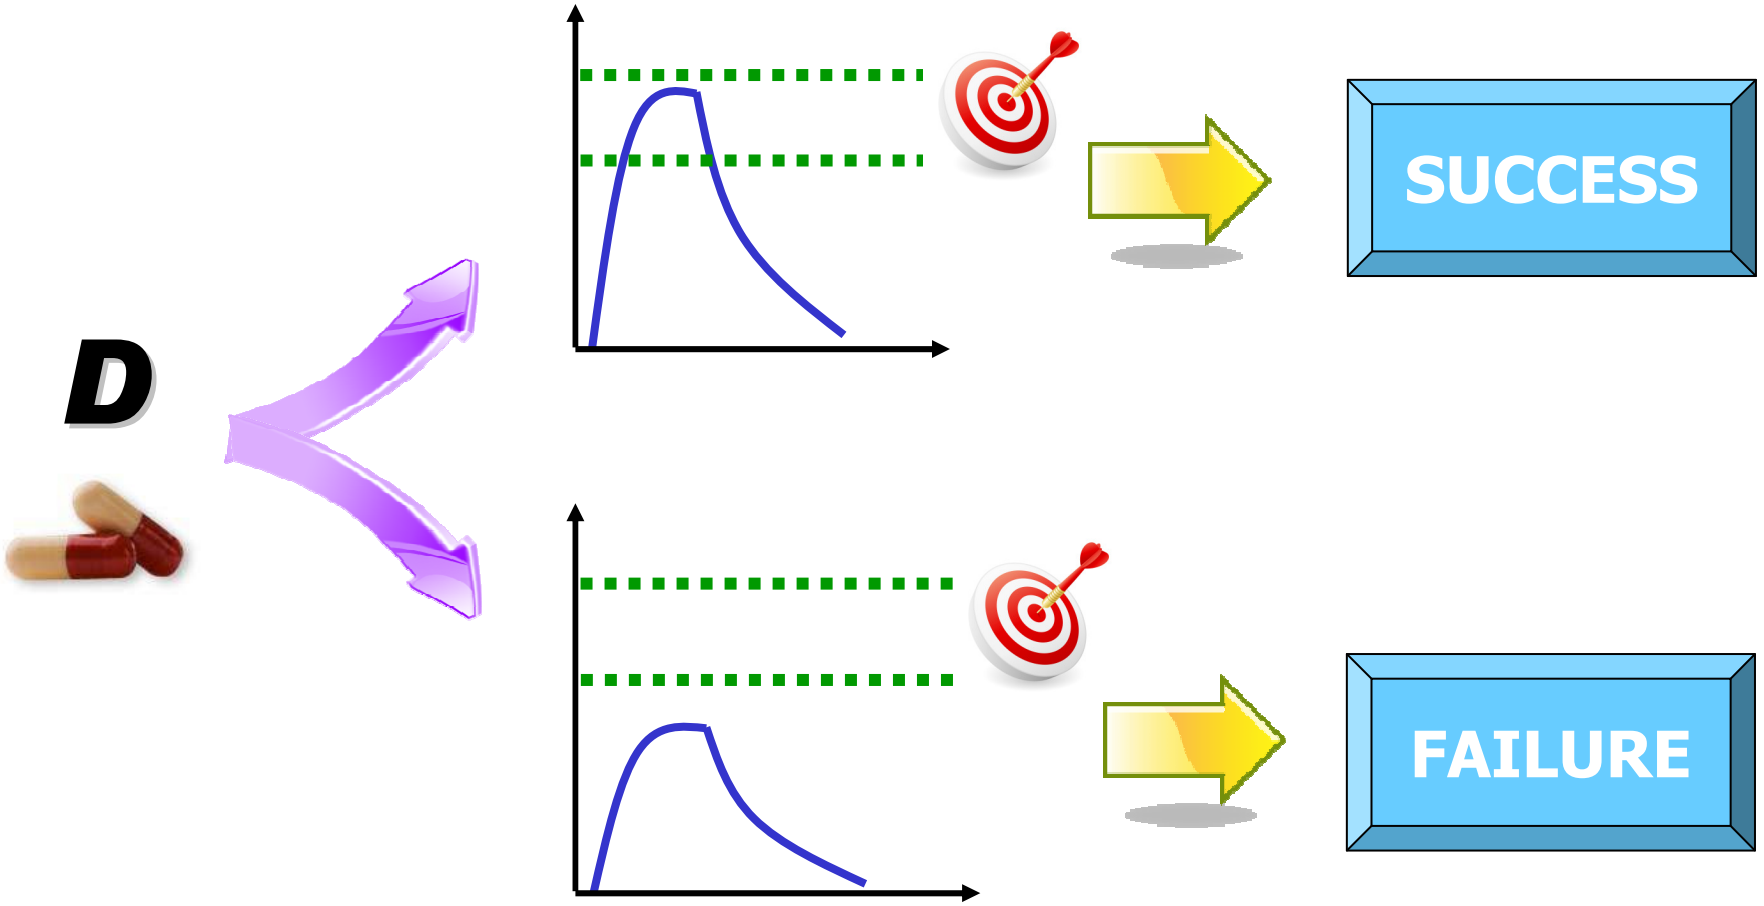
Cmin efficace

Les patients 400 et 800 mg se répartissent indistinctement de part et d'autres de la Cmin efficace!

Inter-patient PK variability makes 400 or 600 mg imatinib give highly variable exposure levels!

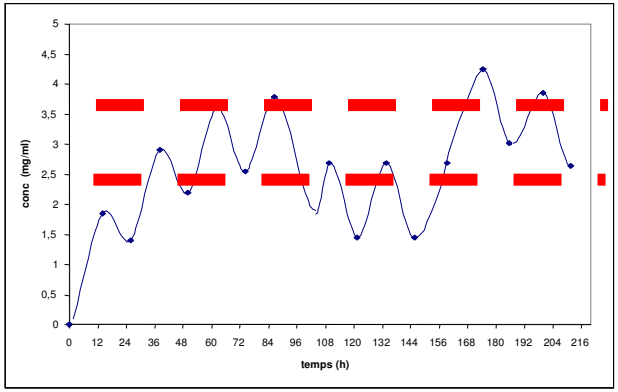
Targeted therapies should have their PK checked too!

Plasma exposure drives the PD…. not the dosing!



PK OF ANTICANCER DRUGS
Performing drug monitoring?

Biotherapies should have their PK checked too.



- Understanding PK and PK/PD of therapeutic antibodies is challenging.
- Lack for bioanalytical support.
- Linear, non-linear or Mixed PK. PD (e.g., receptor expression, tumor burden) can impact on PK parameters!
- Little data made available (Avastin? Rituximab?).
- Cetuximab: Clearance is associated with DFS!
- … Doses should be probably customized too!

PK OF ANTICANCER DRUGS
Performing drug monitoring?

Variable	Strata	Median Time to Progression (days)	p-value
AUC_{inf}	**> 4050 µg/mL.day**	**293**	**0.0059**
	≤ 4050 µg/mL.day	**84**	
CL	> 2.56 mL/kg/day	92	0.0018
	≤ 2.56 mL/kg/day	219	
C_{max}	> 270 µg/mL	233	0.1721
	≤ 270 µg/mL	171	
k_{10}	> 0.0629 / day	152	0.2804
